

Hard foam support elements from Lux Elements: Solutions for modern building design

Lux Elements is an experienced specialist in the production of hard foam support elements for the building, sanitary and wellness markets.

The expanded polystyrene hard foam is produced environmentally compatible without using CO². The hard foam is produced in the own manufacturing plant in France and then processed in the main plant in Leverkusen.

Due to its material characteristics, the material is particularly suitable for damp locations.

The standard program ranges from bath and whirlpool claddings, flush-mounted shower bases, design showers, washstands, relaxation loungers, pipe claddings and the universal construction panel up to complete steam baths.

In addition, we dispose of an own product line for individual custom-made products. For this product line, we produce complete wellness installations for sports and leisure facilities. There are no limits to creativity, even round shapes can be manufactured.

To facilitate processing, Lux Elements also offers system components such as sealing -tapes, -films and -fillers, dowels, adhesives, mortar and mounting corners, all which are tailor-made for our hard foam support elements.
